

FE-1000 INSERTION TYPE AIRFLOW SENSING ELEMENT

DESCRIPTION

The **FE-1000** is an insertion type airflow sensing element designed for quick, easy installation through a small cutout in the existing ductwork. Where multiple elements are required for proper duct traversing, the output ports are manifolded together, external to the ductwork. Each element is furnished complete with mounting hardware, sealing gaskets and signal connection fittings.

The **FE-1000** airflow sensing element is a head type device, which generates a differential (velocity) pressure signal similar to the orifice, venturi, and other head producing primary elements. The **FE-1000** is constructed so that strategically located sensing ports (based on duct size) continually sample the total and static pressures, when inserted normal to flow. The total pressures sensed by the upstream ports are continually averaged within the element in an isolated chamber. The static sensing ports (located where the influence of the velocity head is zero) are averaged in a second isolation chamber. Each chamber is then connected to one side of a differential measurement device (gauge, transmitter, etc.) for flow measurement and indication purposes.

Features

- Low signal-to-noise ratio
- Multiple total and static pressure sensing ports along the length of the element
- Averaging internal manifold
- Insensitive to flow angle variations of as much as $\pm 20^\circ$ when faced in the normal direction of flow
- $\pm 2\%$ accuracy throughout the velocity ranges of 100 fpm and over
- Available in three materials; 6063-T5 aluminum with anodized finish, Type 316 stainless steel, and Type 1 PVC
- Aluminum elements can be operated continuously in temperatures up to 350°F or intermittently in temperatures up to 450°F
- Stainless steel elements can be operated continuously in temperatures up to 1650°F
- PVC elements can be operated continuously in temperatures up to 120°F or intermittently in temperatures up to 170°F
- All three types of elements can be operated in humidity ranges of 0 to 100%
- Aluminum elements have good salt air and mild acid resistance; excellent solvent and aromatic hydrocarbon resistance
- Stainless steel elements have good sulfate, phosphate, salt, and reducing acid resistance
- PVC elements have excellent acid and alkalis resistance
- Furnished complete with mounting hardware, sealing gaskets, and signal connection fittings
- Low installation cost; can be installed through a small cutout in new or existing ductwork
- Economical for multiple branch VAV duct systems

FE-1000 Specifications

1. Accuracy

Within 2% of actual flow (even in moderately turbulent flows) with approach angle variation of $\pm 20^\circ$, when installed in accordance with published recommendations

2. Operating Velocity Range

100 to 10,000 fpm

3. Material

6063-T5 anodized aluminum (standard)
Type 316 stainless steel (optional)
Type 1 PVC (optional)

4. Temperature

Aluminum Elements

350°F continuous operation

400°F intermittent operation

Stainless Steel Elements

1650°F continuous operation, depending upon corrosive conditions of the service

PVC Elements

120°F continuous operation

170°F intermittent operation

5. Humidity

All Elements

0 to 100% non condensing

6. Corrosion Resistance

Aluminum Elements

Good salt, air, and mild acid gas resistance; excellent solvent and aromatic hydrocarbon resistance

Stainless Steel Elements

Good for sulfates, phosphates and other salts, as well as reducing acids such as sulphurous and phosphoric

PVC Elements

Excellent acid and alkalis resistance

7. Connection Fittings

Aluminum Elements

1/4" compression, suitable for use with thermoplastic or

copper tubing

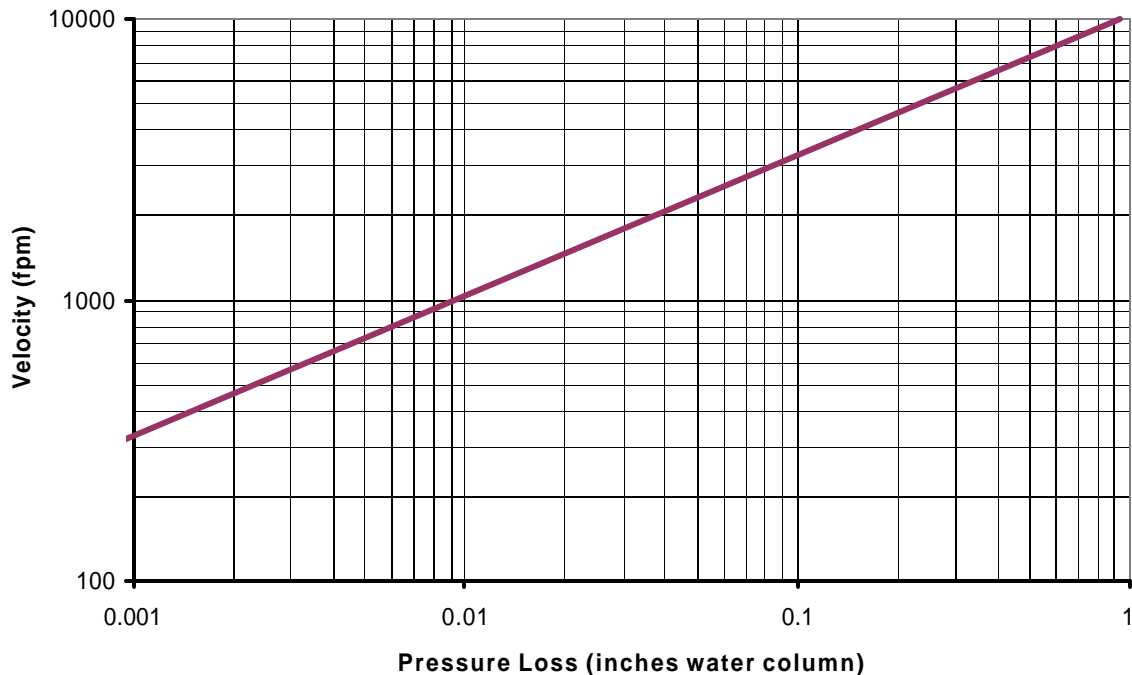

Stainless Steel Elements

1/4" Type 316 stainless steel compression

PVC Elements

1/4" nylon compression

Resistance to Airflow

Dimensions

Aluminum Elements

Note: The 9/16 inch diameter probe is used for elements less than 24 inches long and the 1 inch diameter probe is used for elements greater than 24 inches long.

Dimensions (Continued)

Stainless Steel Elements

PVC Elements

Element Arrangement

RECTANGULAR CONFIGURATION

CIRCULAR CONFIGURATION

OVAL CONFIGURATION

Notes:

- A = Inside duct dimension (element length side)
- B = Inside duct dimension (element mounting side)
- C = Angle between elements, $360^\circ/2N$
- N = Number of elements mounted on 'B' dimension
- For rectangular ducts, if dimension 'B' is less than 12 inches then $N = 2$

Application Guide

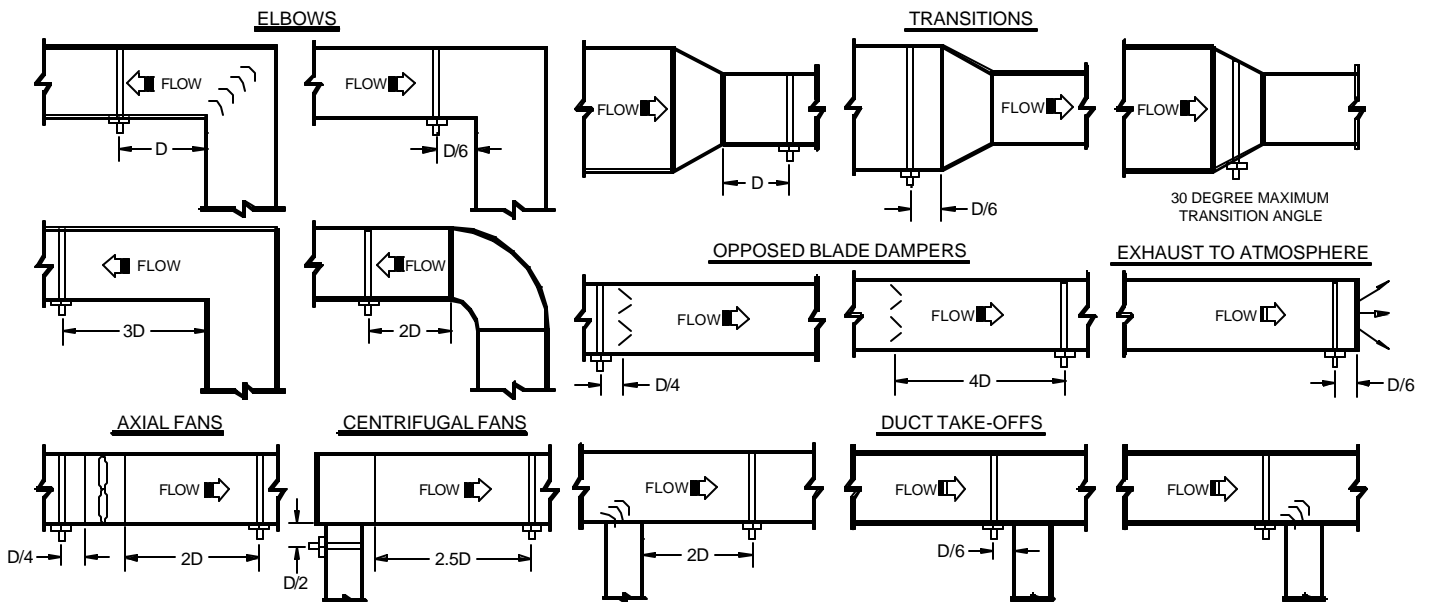

| Rectangular | | Circular | |
|----------------------|-----------------------------|----------------------|-----------------------------|
| Dimension B (inches) | Number of Elements Required | Dimension A (inches) | Number of Elements Required |
| 6 - 11 | 1 | 6 - 11 | 1 |
| 12 - 23 | 2 | 12 - 36 | 2 |
| 24 - 36 | 3 | 37 - 82 | 3 |
| 37 - 64 | 4 | 83 & Over | 4 |
| 65 - 96 | 5 | | |
| 97 & Over | 6 | | |

Notes:

- A = Inside Duct Dimension (Element Length Side)
- B = Inside Duct Dimension (Element Mounting Side)
- For rectangular ducts, one element 'A' inches long is always required
- Oval ducts require one element 'A' inches long and one element 'B' inches long

Minimum Installation requirements

The elements may be installed in any duct configuration. However, the accuracy of the installation is dependent on the flow conditions in the duct. The minimum installation requirements for the elements based upon a uniform velocity profile approaching the duct disturbance for flow rates less than 2,500 fpm are shown below. Add one duct diameter to the installation requirements shown below for each additional flow rate of 1,000 fpm. These are not ideal locations. It is always best to locate the elements as far as possible from all duct disturbances, with upstream disturbances being the most critical consideration.

Notes:

Round Ducts:

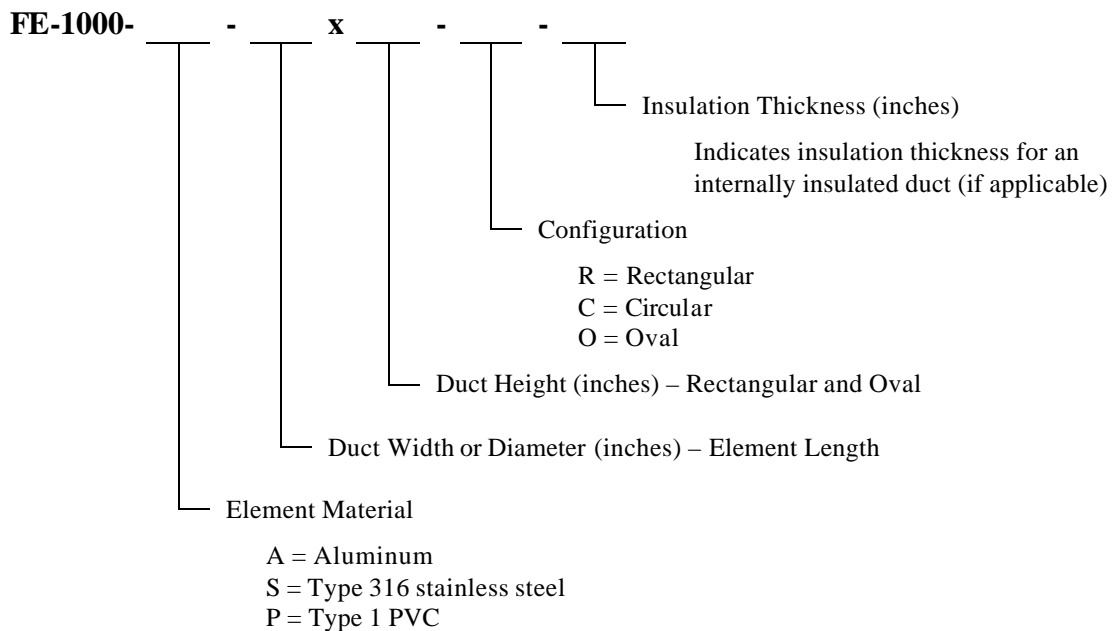

D = Duct diameter

Rectangular Ducts:

$$D = \sqrt{\frac{4HW}{p}}$$

H = Duct height W = Duct width

Ordering Information

Specification Guide

Airflow Measurement Stations

1. Provide where indicated and/or scheduled airflow traverse elements capable of continuously monitoring the duct air volumes they serve.
2. Each element shall be designed and built to comply with, and provide results in accordance with, accepted practice for duct system traversing as defined in the ASHRAE Handbook of Fundamentals, AMCA publication #203, as well as the Industrial Ventilation Handbook. The number of sensing ports on each element, and the quantity of elements utilized at each installation, shall comply with ASHRAE Standard #111 for equal area duct traversing.
3. Each element shall be of a dual integral chambered design. Each airflow measuring element shall contain multiple total and static pressure sensing ports placed along the leading edge of the cylinder. The static pressure chamber shall incorporate dual offset static taps on opposing sides of the averaging chamber, so as to be insensitive to flow angle variations of as much as ± 20 degrees in the approaching airstream.
4. The airflow traverse elements shall be capable of producing steady, non-pulsating signals of true total and static pressure, with an accuracy of 2% of actual flow for operating velocities as low as 180 feet per minute (fpm). Signal amplifying sensors requiring flow correction (K factors) for field calibration are not acceptable.
5. The airflow traverse elements shall not induce a measurable pressure drop, greater than 0.18 inch at 4,000 fpm. The units shall have a self-generated sound rating of less than NC40 and the sound level within the duct shall not be amplified, nor shall additional sound be generated.
6. Where primary flow elements are located outside of the manufacturer's published installation guidelines the manufacturer shall be consulted, and approve of any special configurations, such as air equalizers and/or additional and strategically placed measuring points, as may be required.

Installation Considerations

1. Primary flow elements shall be installed in strict accordance with the manufacture's published requirements and with ASME guidelines effecting non-standard approach conditions. These elements serve as the primary signals for the airflow systems; it shall be the responsibility of the contractor to verify correct installation to assure that accurate primary signals are obtained.
2. An identification label shall be place on each primary flowelement showing airflow direction and listing the model number; system served, size and identifying tag number.

Manufacturer

1. Airflow sensing elements shall be Paragon Controls Inc. Model FE-1000 or equal as approved by the Engineer.
2. Naming of a manufacturer does not automatically constitute acceptance of this standard product nor waive the responsibility of the manufacturer to comply totally with all requirements of the proceeding specification.

Above P_V Values Are Based On Standard Air Density Of 0.075 lbm/ft³ Which Is Air At 68°F, 50% Relative Humidity, And 29.92" Hg.
The equation for converting air volume (Q) into velocity (V) and velocity pressure (P_V) is:

$$V = \frac{Q}{A} \quad PV = \left(\frac{V}{C}\right)^2 \times r$$

Where:
V = Velocity, in fpm C = 1096.7
Q = Flow, in cfm ρ_a = Density of air, in lb/ft³
A = Area, in ft² P_V = Velocity pressure, in inches H₂O
